KNEE RADIOGRAPH QUANTITATIVE ANALYSIS & ANATOMICAL REPORT

1. Patient & Examination Details

Patient Name:	Patient PT-20260915	Patient ID:	PT-20260915
Age / Sex:	58 yrs / Female	Study Case ID:	case_20260915_124517
Attending Physician:	Dr. Alex Morgan, MD	Department:	Department of Orthopedic Surgery & Musculoskeletal Radiology
Analysis Date & Time:	15 Sep 2026, 12:45 PM	Projection View:	AP (FRONT)

3. Quantitative Anatomical Measurements

Anatomical Parameter	Quantitative Value	Methodology / Anatomical Reference
Femoral Mediolateral Width	Not available	Distance across distal femoral condyles (Front AP)
Femoral Anteroposterior (AP)	Requires lateral radiograph	Condylar depth measured from lateral radiograph
Tibial Plateau Width	Not available	Transverse span of proximal tibial articular plateau (Front AP)
Tibial Anteroposterior (AP)	Requires lateral radiograph	Plateau depth measured from lateral radiograph
Medial Joint Space Width (JSW)	Not available	Articular clearance height, medial load-bearing zone
Lateral Joint Space Width (JSW)	Not available	Articular clearance height, lateral compartment
Minimum JSW (Focal Clearance)	Not available	Narrowest anatomical clearance across articulation
Joint Space Articulation Area	Not available	Segmented 2D clearance envelope between femur and tibia
Meniscus Tissue Analysis	Evaluated via radiolucent clearance	Plain radiograph measures radiolucent joint clearance. Direct fibrocartilage tear assessment requires MRI.
Mechanical Axis / Alignment	Not calculated on focal X-ray	Requires full-length weight-bearing long leg alignment radiograph.

4. Technical Quality Control & System Calibration

Analysis Status:	INVALID	AI Quality Score:	0.0% (Reliable)
Calibration Mode:	Pixel Units (px)	Pixel Spacing:	Not provided (px only)
Segmentation Network:	ORTHINX Knee U-Net (v2.0)	Inference Latency:	71.02 ms

5. Clinical Findings & Summary

Summary of Findings: Quantitative analysis of the uploaded front radiograph demonstrates femoral condyle width of Not available and tibial plateau width of Not available. Morphological boundaries successfully delineated in sensor pixel coordinates. Calibrate pixel spacing for mm-scale grading. All measurements are derived directly from patient anatomical boundaries.

CLINICAL NOTICE: This document contains quantitative morphological measurements computed by the ORTHINX Clinical Suite. Findings are intended to support certified orthopedic specialists and radiologists in surgical planning and diagnostic review. Physical dimensions are contingent upon verified pixel spacing calibration. Generated on 15 Sep 2026, 12:45 PM.
